

PRESS RELEASE

7 May 2010. Auckland

Safety Comes First in Fat & Bone Trimming

Operator safety is significantly improved with the latest generation in trimming tool technology, the IBEX Electric Drive System. The IBEX Electric Drive System removes the flex shafts from the trimmers and with it all the inherent issues. In addition to this, the system is also now powered by a low voltage direct current removing the need for dangerous high voltage systems on the processing floor.

"When innovating our electric drive system we were trying to not only develop a system that was cheaper to run and required fewer spares, but to create one that was also safer to use," comments Ray Connor, General Manager of IBEX Industries Limited. "By making the IBEX Electric Trimmer a direct drive system, with the motor in the handpiece, the flex shaft cable wasn't required from the onset. This saves on costly spares and helps reduce injuries associated with vibration in cables. It's a win-win situation."

The other significant benefit in placing a low voltage motor in the handpiece of the Electric Trimmer is the high voltage systems on the processing floor can be removed. The IBEX Electric Direct Drive System eliminates the risk of being exposed to high voltage while still providing substantial power outputs to handle any trimming requirement.

Through continuous improvement and innovation IBEX offers a trimming system that not only is safer to use, but also lowers operating costs and delivers superior performance.

IBEX's product range will be on display at **IFFA 2010** in **Hall 9.1, Stand C11**.
